## About Me

- Innovator and creative thinker
- Mom of 4 girls
- AI literacy advocate
- 24 years at a Big 4
- Social activist
- Volunteer as Mason HS advisor |  
PMI board member of professional  
development | Greenheart International  
local coordinator

## Prompting ICE Breaker

Given everything you know about me—my experiences, beliefs, work, ambitions, strengths, and the questions that have shaped my life—imagine that I have been abducted and transported to Mars, where I am condemned to spend the rest of my days in a penal labor colony.

I am permitted one final request to an advanced AI: a single prompt and its response. The answer will not secure my immediate freedom, but it may give me hope, help me endure, reveal a path toward eventual release, or leave behind something meaningful for those who remain on Earth.

What would my one prompt be, and how would the AI answer it?

# Crossing the Embodiment Threshold

Digital coordination via APIs is only half the story. Embodiment introduces real sensor data, physics constraints, and irreversible consequences.

## Digital Realm

- Discrete state spaces.
- Instant execution.
- Easily reversible.
- Cheap to reset/retry.
- Deterministic simulation.

MS 365 Copilot

## Physical Realm

- Continuous dynamics.
- Actions unfold over time.
- Often irreversible.
- Costly errors (equipment damage, injury).
- Stochastic, noisy processes.

MS Copilot Studio

# Recall what makes an AI Agent

## Beyond Chatbots: Defining the AI Agent

“An AI Agent is a smart software service that combines three critical elements to perceive, reason, and act.”

### Triad of Agency

NOTE: MS says agent, however:

- MS 365 copilot (assisted agent builder/non autonomous)
- MS Copilot studio (true agent and multi-agents)

# MS 365 Copilot has pre built agents (like chat bots, not true autonomous agents)

# MS Copilot Studio – Components of an Agent

Note: you do not see tools, so not a true agent

## Explore the components of an agent

An agent created by everyday business users in SharePoint and Microsoft 365 Copilot Chat includes the following fields:

| Field           | Description                                                                                                                                                                       |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name            | The name of your agent (30 characters max)                                                                                                                                        |
| Icon            | You can manually upload an image to represent your agent and give it a unique personality. The image must be a .png file and it can't exceed 1MB in size                          |
| Description     | The description helps the Large Language Model (LLM) identify and use your agent for a specific task or situation (1,000 characters max)                                          |
| Instructions    | Specific instructions for the LLM to direct the behavior of the agent, including its tasks and how it completes them (8,000 characters max)                                       |
| Knowledge       | You can specify up to 20 knowledge sources, including SharePoint sites, folders, files, and Microsoft Graph connectors                                                            |
| Capabilities    | You can enhance a Microsoft 365 Copilot Chat agent by enabling two advanced features: Code interpreter and Image generator. These features are not available in SharePoint agents |
| Starter Prompts | You can optionally add predefined suggestions or questions designed to help users initiate a task or conversation                                                                 |

# Open Copilot Studio

<https://copilotstudio.microsoft.com/>

# Orchestration – Rule of Simplicity

# Microsoft Teams Agentic Workflow

Use case portfolio for an orchestrator that captures requests, routes work, diagnoses issues, and escalates when needed.

Orchestrator • Intake & Escalation •  
Troubleshooting

# Three-agent operating model

Each use case can be expressed through the same reusable Teams-based pattern.

## What each gear does

01

### Orchestrator

- Controls conversation state
- Routes requests to the right subsystem
- Tracks owner, priority, and next action

02

### Intake & Escalation

- Captures request context
- Creates tickets, tasks, or Teams handoffs
- Escalates exceptions to humans

03

### Troubleshooting

- Runs guided diagnostics
- Retrieves knowledge and prior resolutions
- Recommends fixes or containment actions

# Operational support use cases

Best when the workflow starts as a user request or system alert and ends with resolution or escalation.

---

## 1 IT help desk

Capture issue, user, device, urgency, screenshots  
Route to password, network, device, or app support  
Recommend known fixes before a human handoff

## 2 Application support

Triage severity and affected application  
Check logs, known issues, dependency health  
Open incident bridge or service ticket

## 3 Cloud operations

Intake Azure alerts and Teams reports  
Route by subscription, service, owner, and environment  
Suggest remediation steps and post status updates

## 4 Facilities support

Capture location, asset, urgency, and images  
Route to building, maintenance, security, or vendor  
Track completion and occupant communications

**Common flow: request / alert → route → diagnose → resolve → escalate**

### Employee Onboarding Process Improvement Project Charter

The purpose of this project is to improve the employee onboarding process so new hires have a consistent, organized, and welcoming experience from offer acceptance through their first 90 days. The current process varies by department and manager, which can cause delayed equipment, missing system access, unclear communication, and extra follow-up for HR, IT, payroll, and hiring managers.

This project will standardize key onboarding steps, clarify ownership, reduce delays, and improve the new hire and manager experience. The work includes reviewing the current process, identifying pain points, creating a standardized onboarding checklist, defining roles and responsibilities, updating communication templates, and developing tools such as a manager guide, first-day agenda, IT access checklist, compliance tracker, and 30/60/90-day conversation guide.

In scope: HR coordination, IT setup, payroll readiness, benefits communication, manager preparation, compliance training, first-week scheduling, and stakeholder feedback from HR, IT, payroll, managers, department leaders, and recent new hires.

Out of scope: redesigning recruiting, changing compensation or benefits, replacing HR/payroll systems, or creating role-specific training for every department.

Key stakeholders include HR, IT, payroll, hiring managers, department leaders, recent new hires, and the project sponsor. HR will serve as the primary process owner. The project manager will coordinate work, manage deliverables, track risks, communicate progress, and ensure the final process meets approved objectives.

# multi-agent team

Used Mike's agent builder (lab 11) in Copilot Studio; told it build a max of 5 agents

To implement you need the tools

- real data
- access security permissions
- tool set up
- which may require your IT department

## The team

## Revolutionizing Employee Onboarding: The Multi-Agent AI Blueprint

### Jordan: The Intelligent Orchestrator

The sole point of contact who greets users, classifies intent, and synthesizes multi-agent responses.

### Four Specialized Domain Experts

#### Maya: HR Process Coordinator

Tracks tasks, checklists, and 30/60/90-day milestones.

#### Rafael: IT Setup Specialist

Verifies hardware provisioning and system access readiness.

#### Priya: Payroll & Compliance

Monitors enrollment deadlines and mandatory training completion.

#### Sam: Experience Guide

Delivers resources, FAQs, and collects milestone feedback.

### The Automated Workflow

#### Modular and Scalable Design:

Jordan invokes multiple agents simultaneously for complex requests, combining findings into one response.

#### Proactive Risk Escalation

Automatically flags "Day 1 readiness failures" to human HR coordinators to prevent onboarding delays.

#### Read-Only Compliance Guardrails

Sensitive payroll and PII data are masked and handled through read-only summaries for security.

Let's walk through the blueprint we created

# Our 4-minute video explaining how to create employee onboarding experience using multi-agents (created in Notebook LM)

# Google's Notebook LM

The screenshot displays the Google Notebook LM interface, which is divided into three main vertical panels: Sources, Chat, and Studio.

- Sources Panel:** Features a header "Sources" with a list icon. Below it is a button "+ Add sources". A search bar prompts "Search the web for new sources" with filters for "Web" and "Fast Research". At the bottom, it states "Saved sources will appear here" and provides instructions: "Click Add source above to add PDFs, websites, text, videos, or audio files. Or import a file directly from Google Drive."
- Chat Panel:** Features a header "Chat" with a list icon. It shows a placeholder image and a "Customize" button. The main content area displays "Untitled notebook" and "0 sources · Jul 13, 2026".
- Studio Panel:** Features a header "Studio" with a list icon. It contains a grid of interactive tools: "Audio Overview", "Slide Deck", "Video Overview", "Mind Map", "Reports", "Flashcards", "Quiz", and "Data Table". Each tool has a right-pointing arrow. Below the grid, it states "Studio output will be saved here." and "After adding sources, click to add Audio Overview, Study Guide, Mind Map, and more!"

The top navigation bar includes a "Create notebook" button, "Analytics", "Share", "Settings", a "PRO" badge, and a user profile icon.
